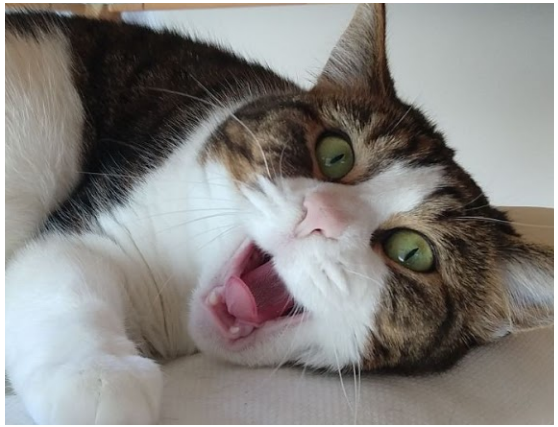
Image Classification



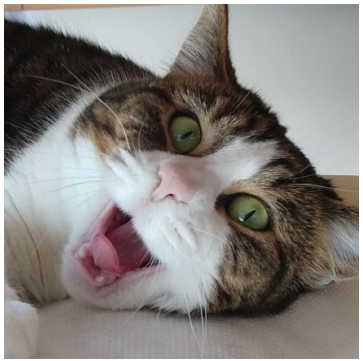
5.1	cat	1
2.3	car	0
-0.7	frog	0

One-hot encoding

Image Classification

Input image

x



f(x,W)

10 numbers for class scores

W

Parameters or weights

Image Classification

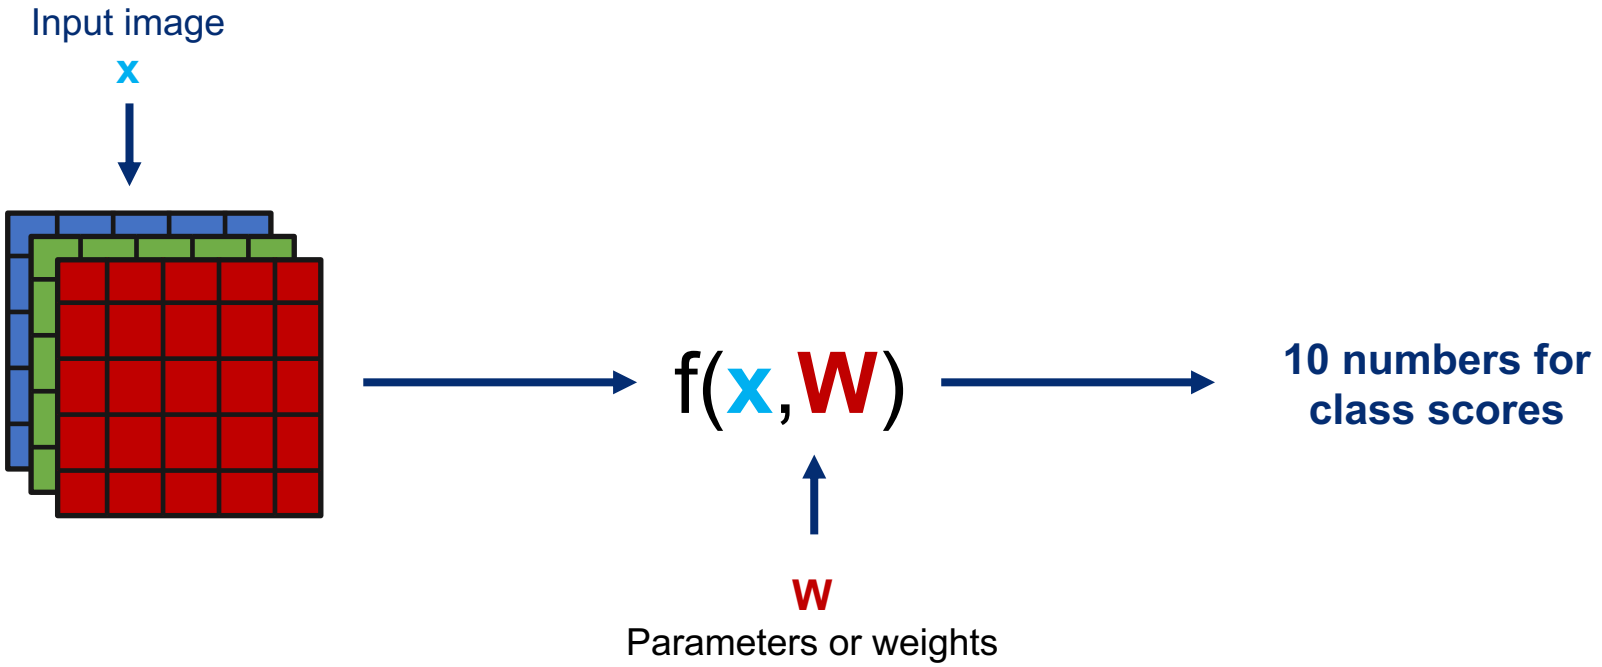


Image Classification

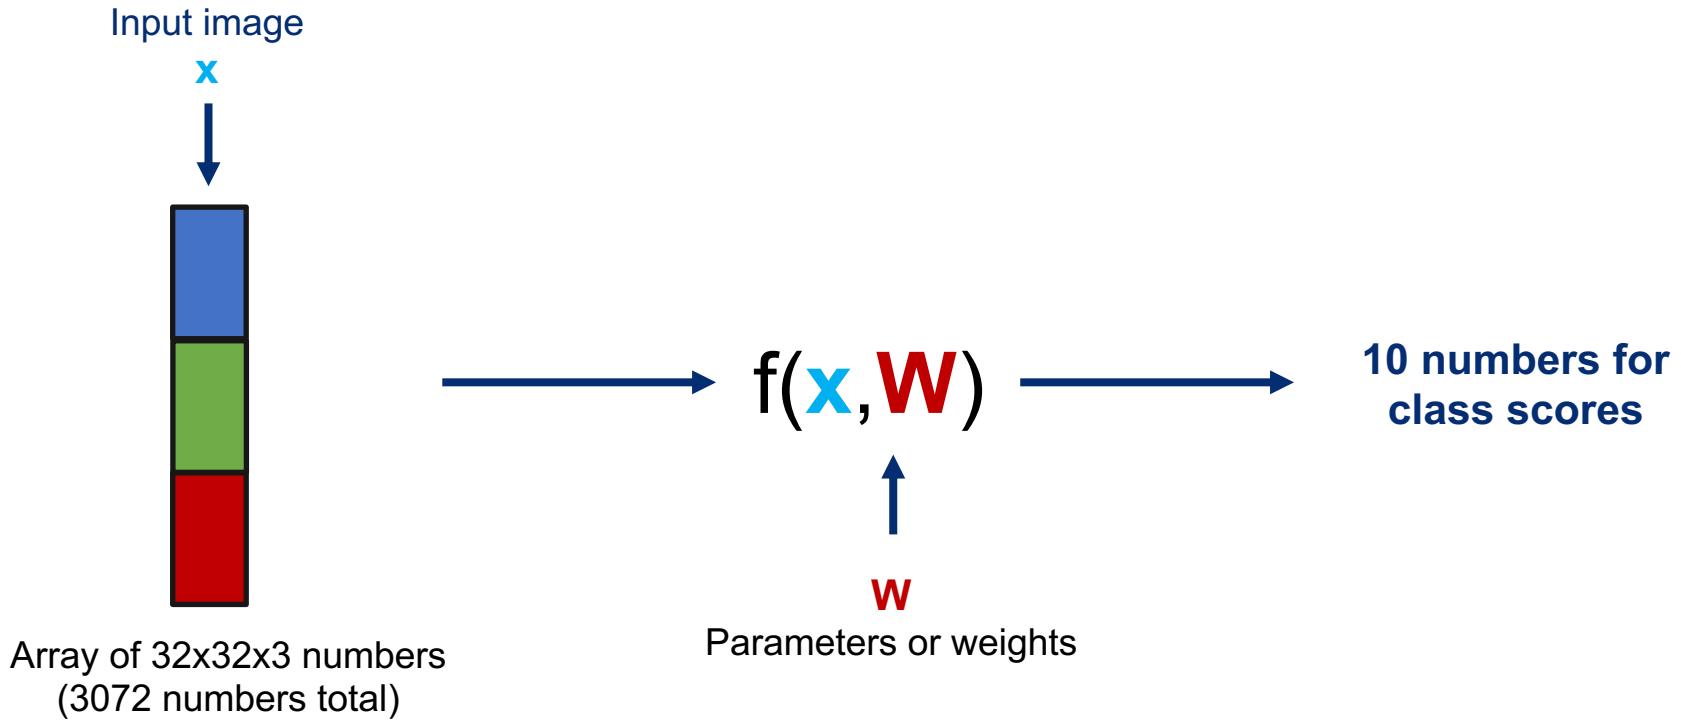
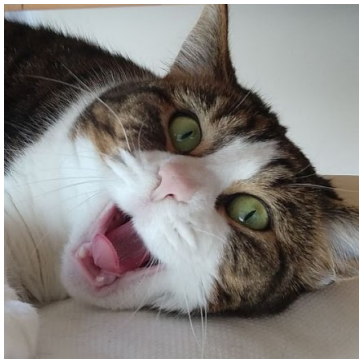


Linear Classifier

Input image

x



Array of 32x32x3 numbers
(3072 numbers total)

3072 x 1

$$f(x,W) = Wx + b$$

10 x 1

10 x 3072

10 x 1

Bias term: constant!
→ Input independent preference

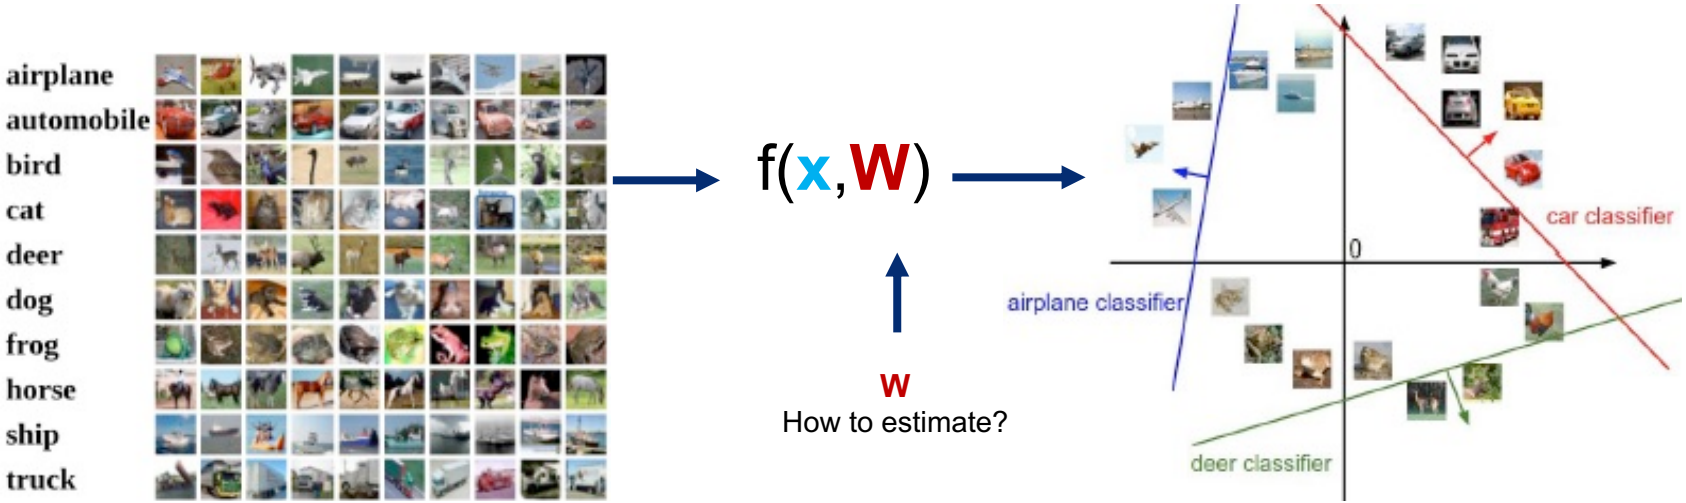
$f(x,W)$ → **10 numbers for class scores**

W

Parameters or weights

Training

Scores: $s = f(x_i, W) = Wx_i + b$



Loss Function

Loss function: quantifies classifier performance

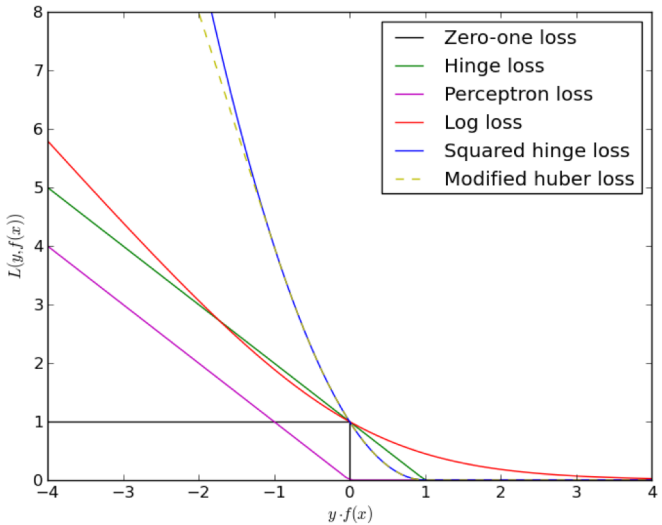
Given a dataset $\{(x_i, y_i)\}_{i=1}^{N}$ where

x_i is the image (or feature representation)

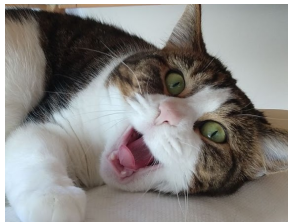
y_i is the corresponding label (integer)

Loss over the dataset: sum over all examples

$$L = \frac{1}{N} \sum_i L_i \left(f(x_i, W), y_i\right)$$



The Mean Squared Error



Loss: $L_i = (y_i - s_i)^2$

True label

compare

3.2 → ← 5

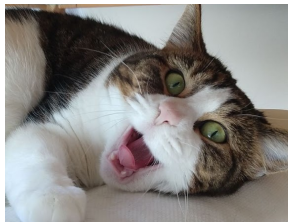
$L_i = (5 - 3.2)^2 = 3.24$

Negative Log Likelihood

		True label for cat (one-hot encoding)
Cat	**3.2**	**1.00**
Car	5.1	0.00
Bird	-1.7	0.00

Negative Log Likelihood

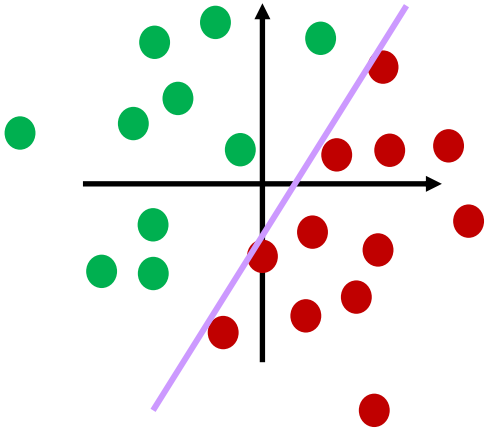
$$P(Y = k|X = x_i) = \frac{e^{s_k}}{\sum_j e^{s_j}}$$

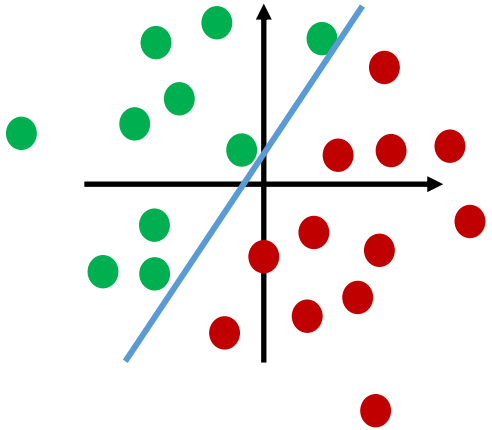


Loss: $L_i = -\log P(Y = y_i|X = x_i)$ → Log-likelihood of true class

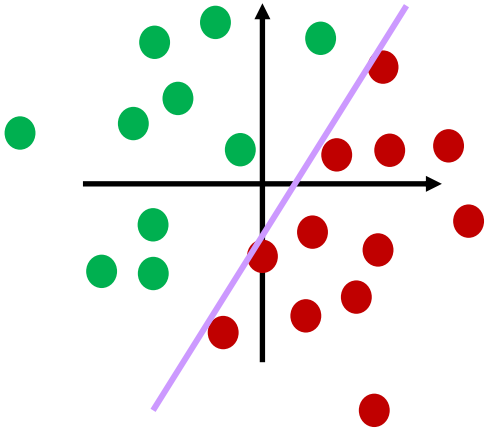
		exp()	normalize		
Cat	**3.2**	**24.4**	**0.13**	→	L_i = -log(0.13) = **0.89** or **2.04**
Car	5.1	164.0	0.87		
Bird	-1.7	0.18	0.00		
		Probabilities are ≥ 0	Probabilities must sum to 1		

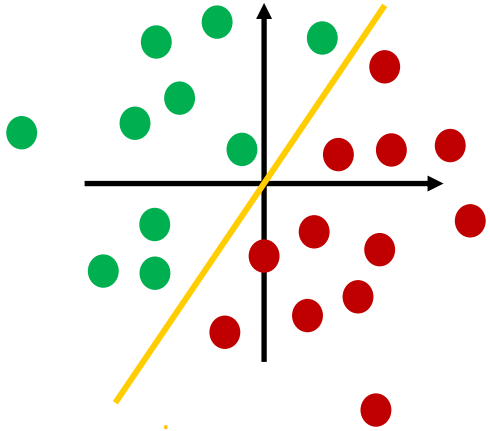
Which W to choose?



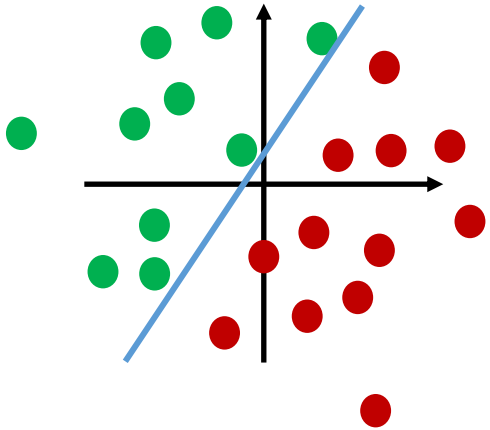


Which W to choose?

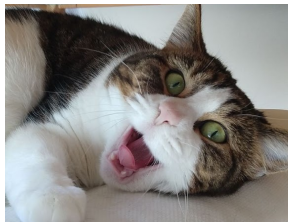




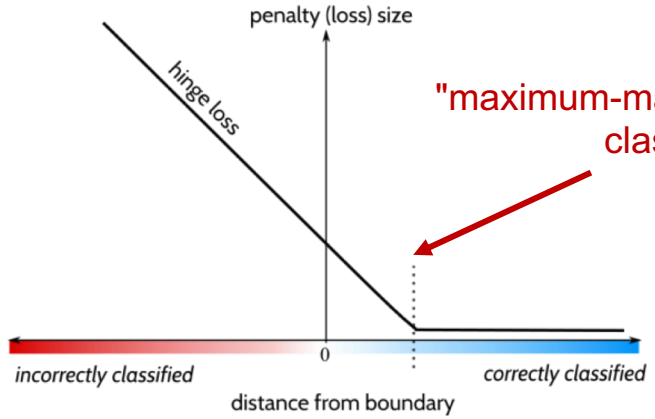
max margin



The Hinge (SVM) Loss



Cat	**3.2**	1.3	2.2
Car	5.1	**4.9**	2.5
Bird	-1.7	2.0	**-3.1**

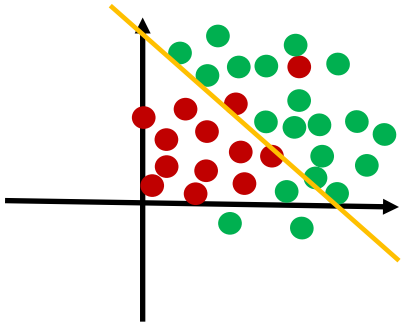


Loss:

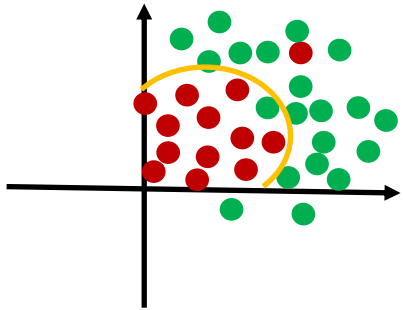
$$L_i = \sum_{j \neq y_i} \begin{cases} 0 & \text{if } s_{y_i} \geq s_j + 1 \\ s_j - s_{y_i} + 1 & \text{otherwise} \end{cases}$$

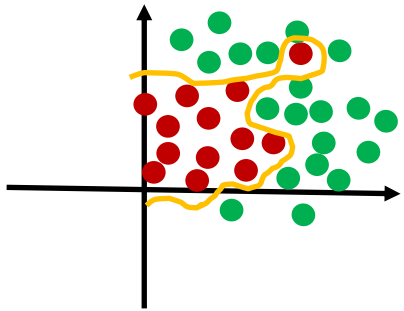
$$= \sum_{j \neq y_i} \max(0, s_j - s_{y_i} + 1)$$

Bias and Variance



High bias





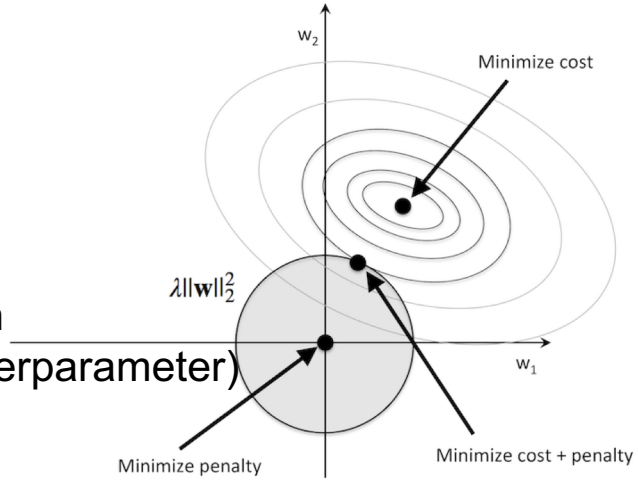
High Variance

Norm Regularization

$$L(W) = \underbrace{\frac{1}{N}\sum_i L_i\left(f(x_i, W), y_i\right)}_{\text{Data term}} + \underbrace{\lambda R(W)}_{\text{Regularization}}$$

Data term: Predictions must match annotations

Regularization λ strength (hyperparameter)



Simple regularizers

- L2 (magnitude): $R(W) = \sum_{k,l} W_{k,l}^2$
- L1 (sparsity): $R(W) = \sum_{k,l} |W_{k,l}|$
- Versions, e.g. Elastic net, Huber,…

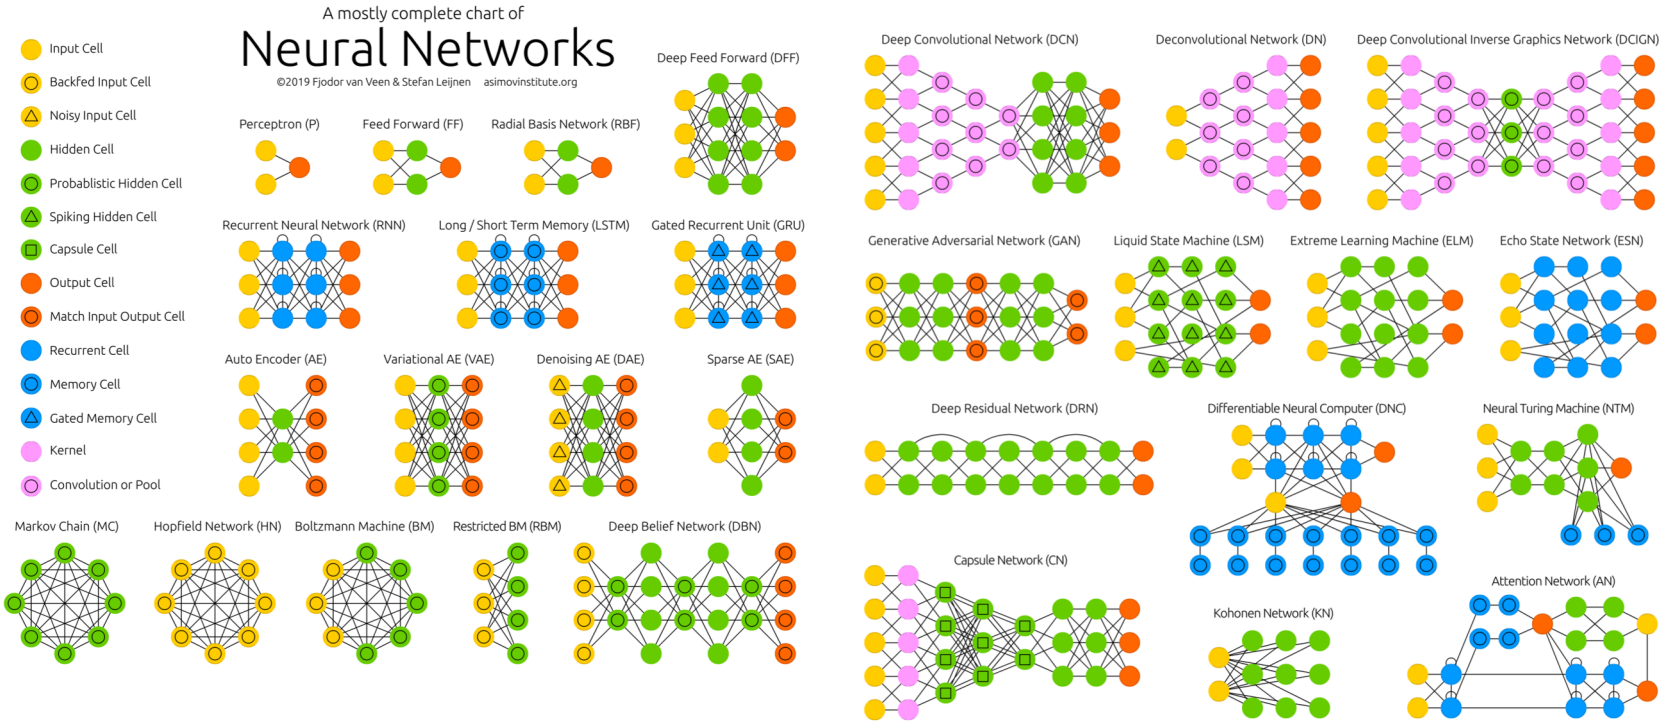
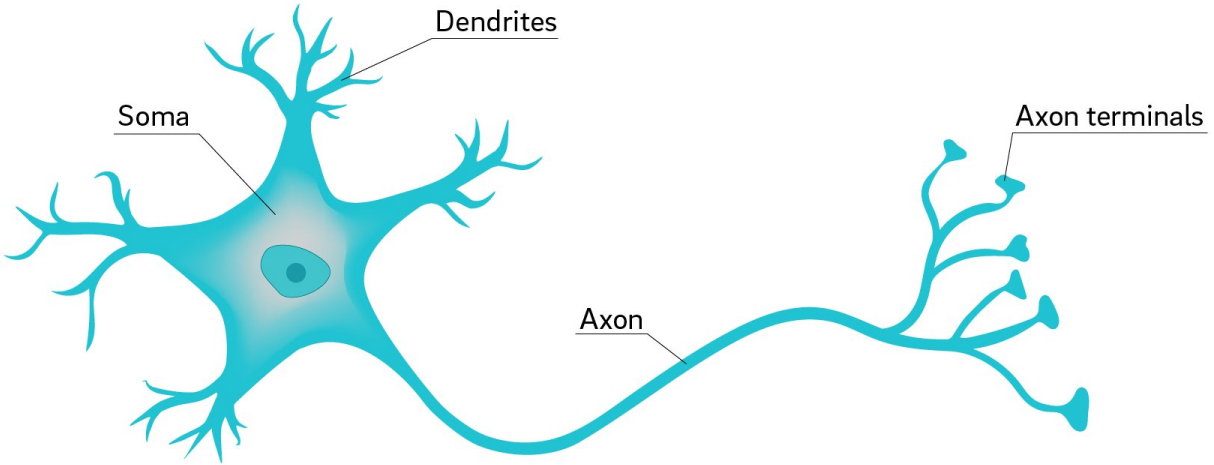
Neural Network Zoo (2016)



https://www.asimovinstitute.org/neural-network-zoo/

Neuron

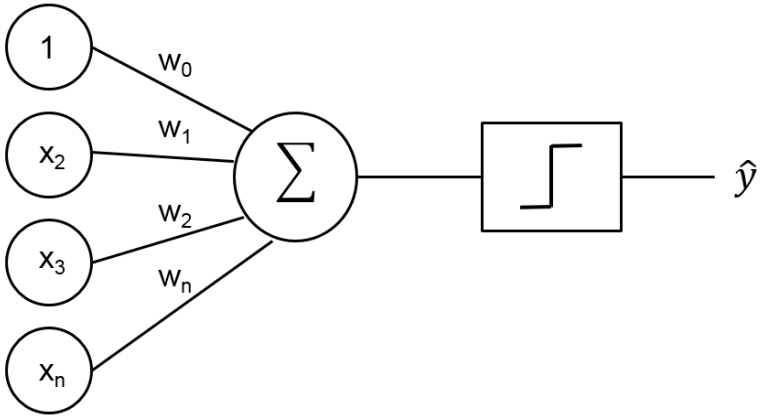
- Neural networks imply connections to neurons



- Signal comes in through dendrites into soma
- Then connects via the axon to other neurons
- Fires if input exceeds a certain threshold

Neuron

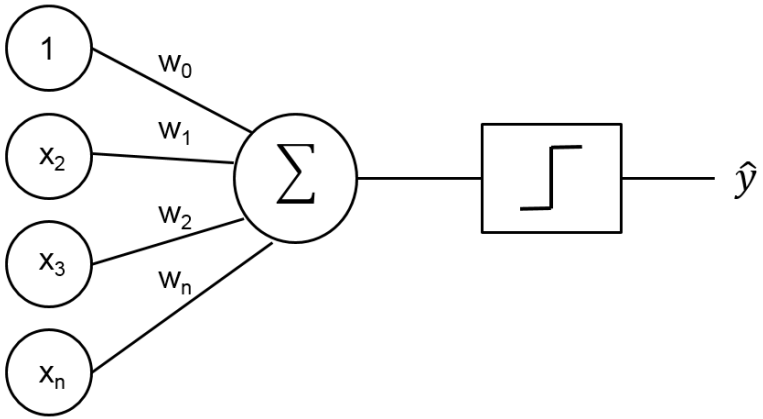
- Neural networks imply connections to neurons

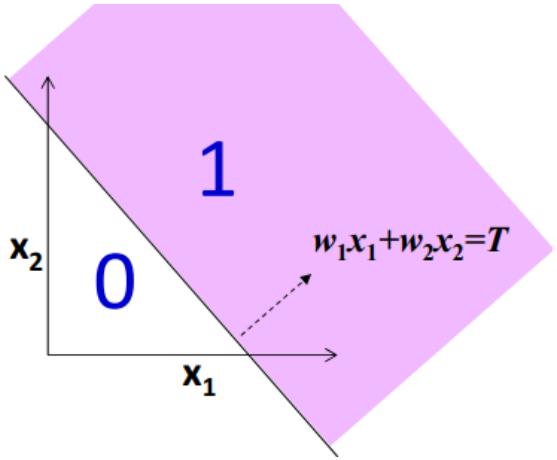


- Signal comes in through dendrites into soma
- Then connects via the axon to other neurons
- Fires if input exceeds a certain threshold

Perceptron

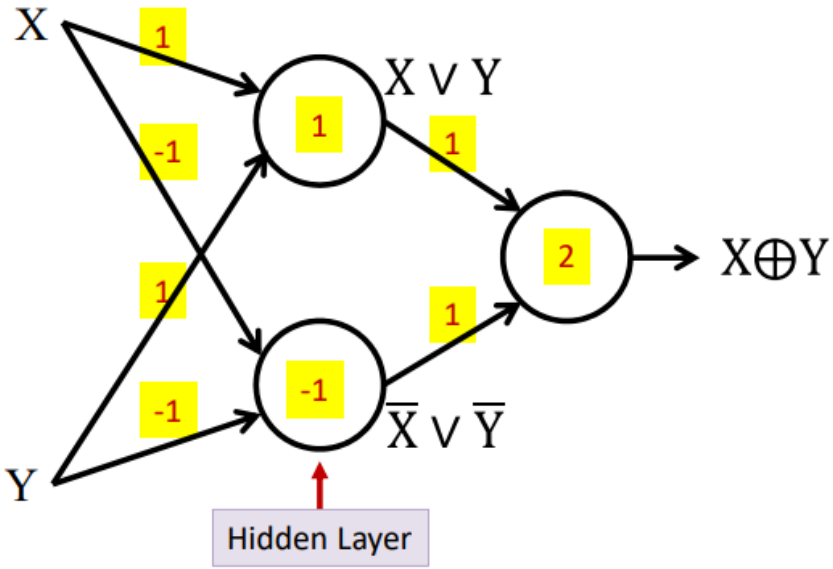
The perceptron can model almost all Boolean gates but in the end it is still a linear classifier





A Single Perceptron is Not Enough

Individual perceptrons are weak → Networked elements required!

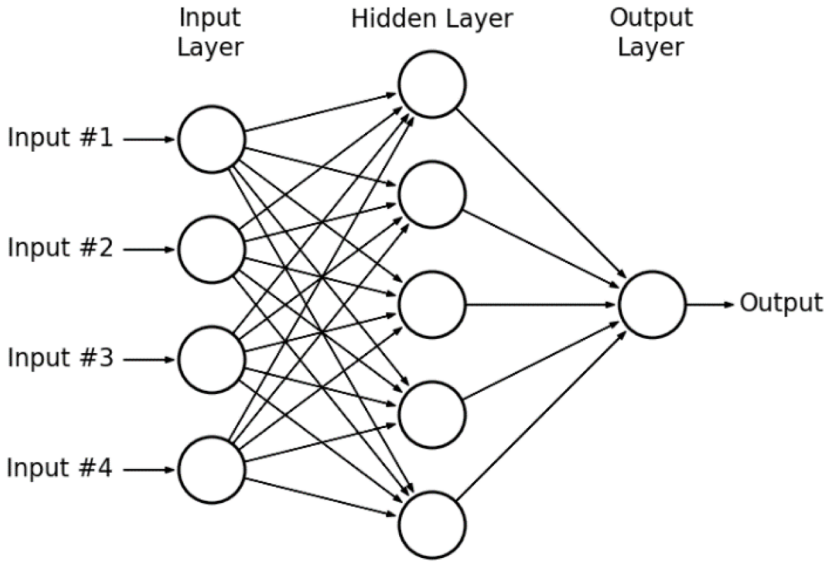


(X or Y) and (Not X or Not Y) → XOR

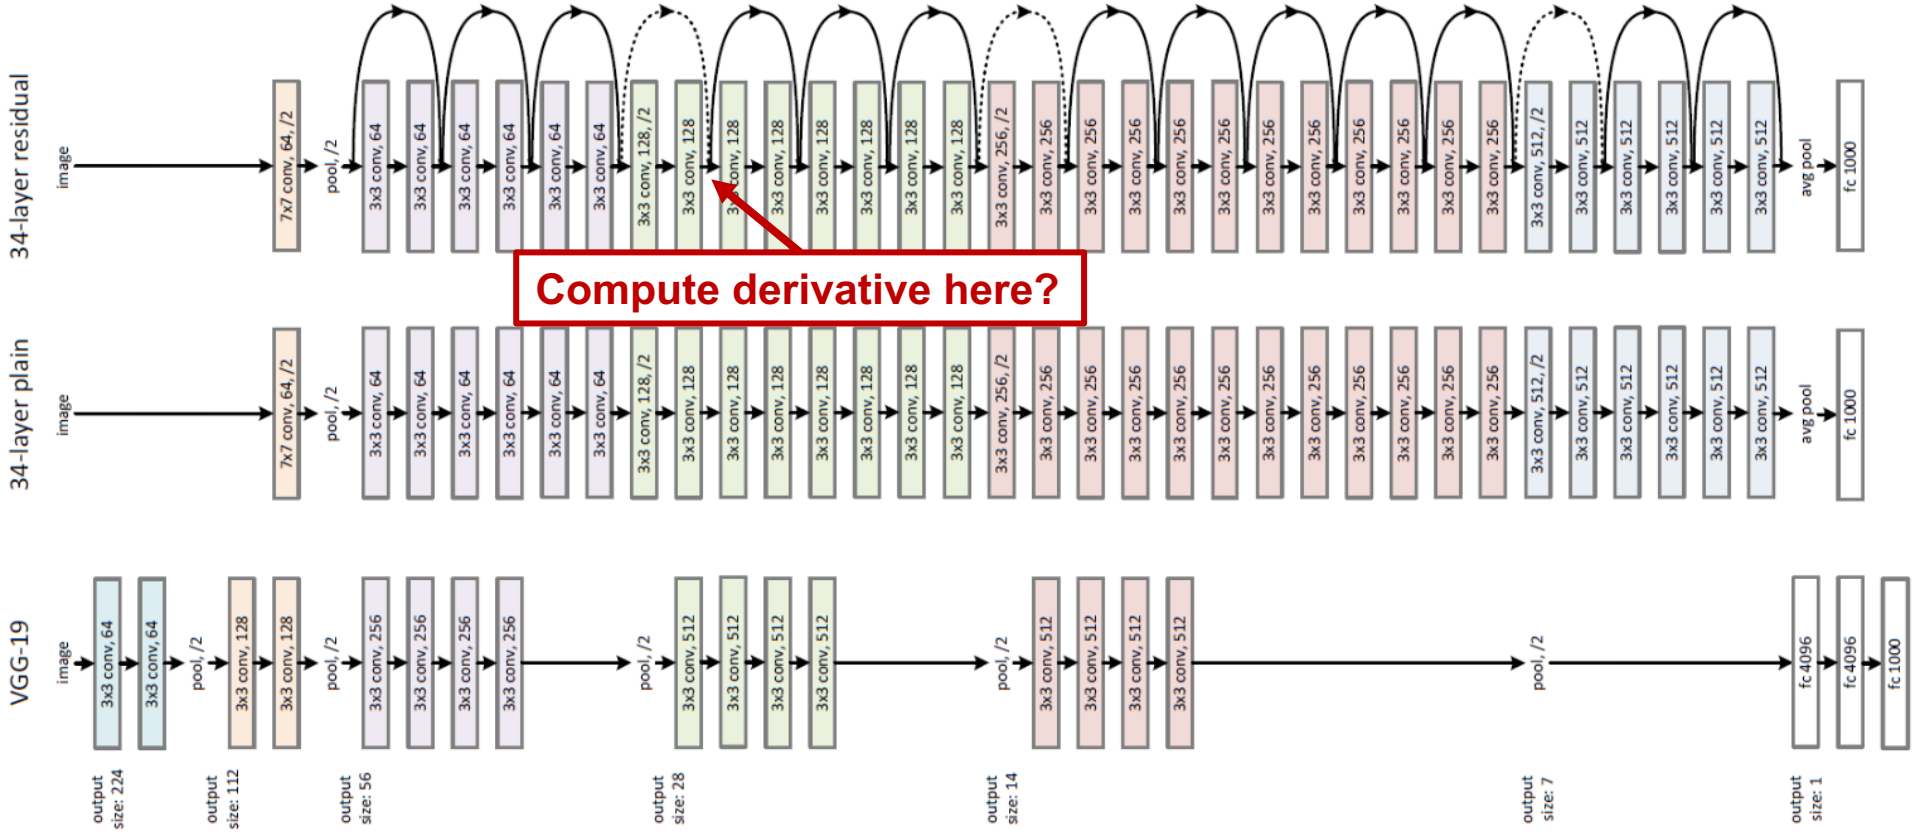
Minsky, M., & Papert, S. (1969). Perceptron Expanded Edition.

Multi-layer Perceptron

Multi-layer perceptrons can compose arbitrarily complex functions.



Computational Graphs



Computational Graphs

Score function: $s = f(x_i, W) = Wx_i$

Loss function: $L_i = \sum_{j \neq y_i} \max(0, s_j - s_{y_i} + 1)$

$$L(W, x) = \frac{1}{N} \sum_i L_i \left(f(x_i, W), y_i\right) + \lambda R(W)$$

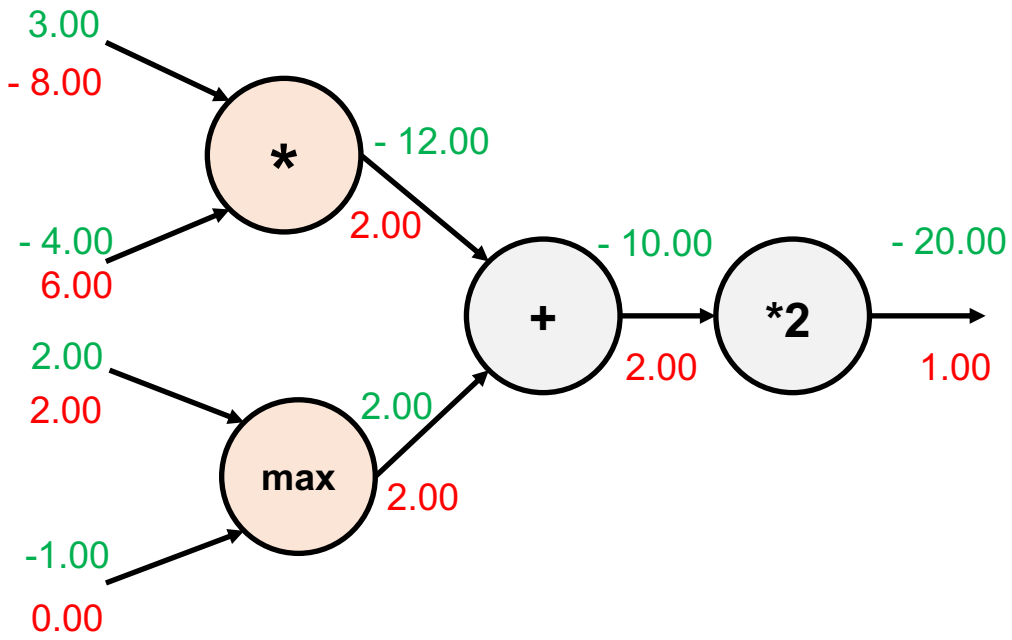
Max node

→ Routes gradient

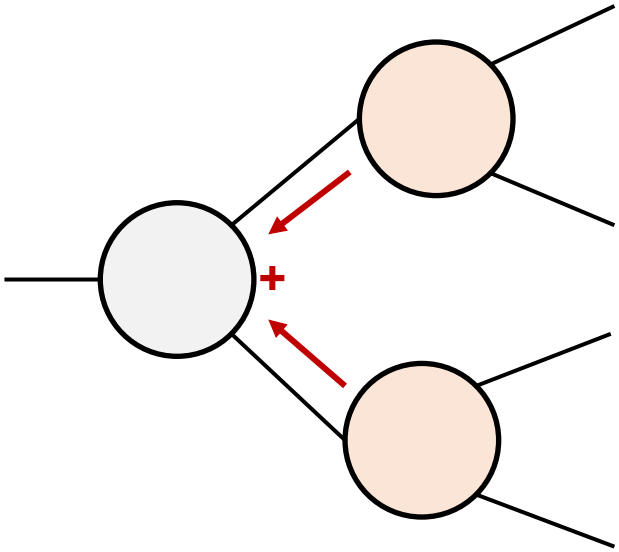
Mul node

→ Switches gradient



Patterns in Flow

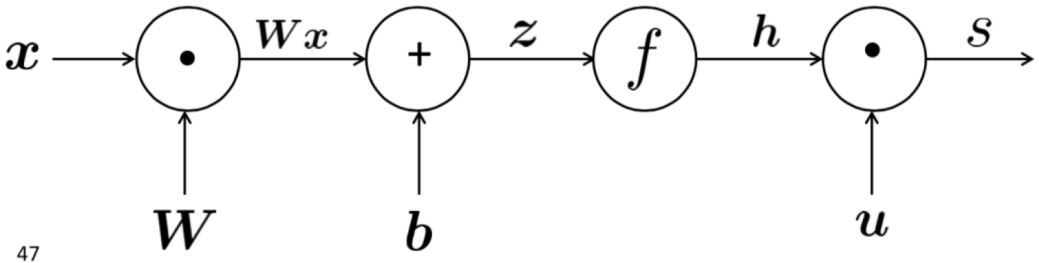
Gradients add at branches



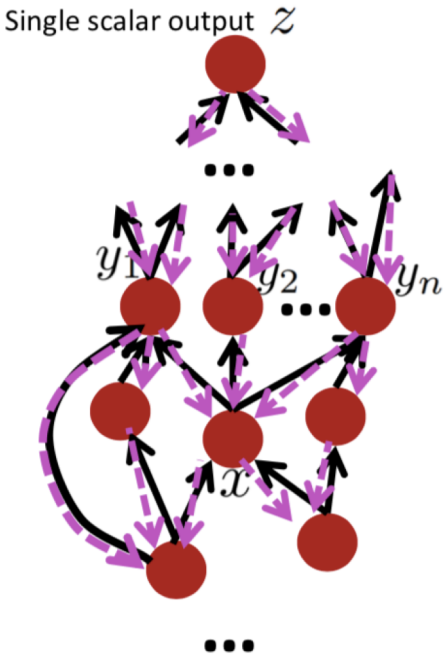
Backpropagation Algorithm

Compute derivatives of the loss wrt to all parameters of the network

- **breakdown the networks computation into small steps**
- define local derivatives of outputs wrt to inputs
- recursively apply the chain rule to compose derivatives
- re-use intermediate values computed in previous steps



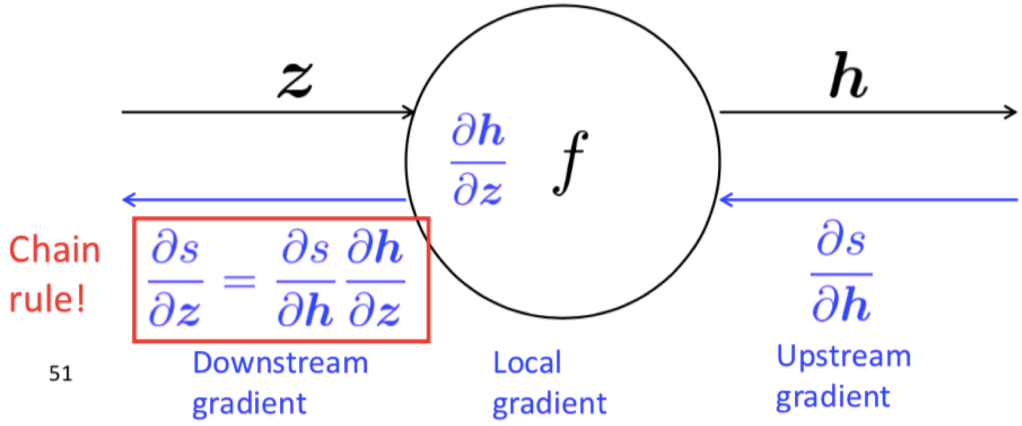
47



Backpropagation Algorithm

Compute derivatives of the loss wrt to all parameters of the network

- breakdown the networks computation into small steps
- **define local derivatives of outputs wrt to inputs**
- recursively apply the chain rule to compose derivatives
- re-use intermediate values computed in previous steps

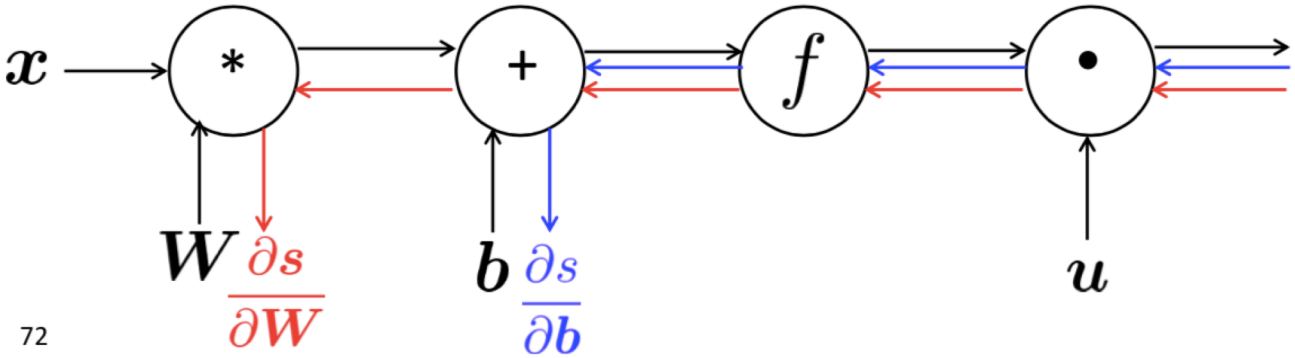


51

Backpropagation Algorithm

Compute derivatives of the loss wrt to all parameters of the network

- breakdown the networks computation into small steps
- define local derivatives of outputs wrt to inputs
- **recursively apply the chain rule to compose derivatives**
- re-use intermediate values computed in previous steps

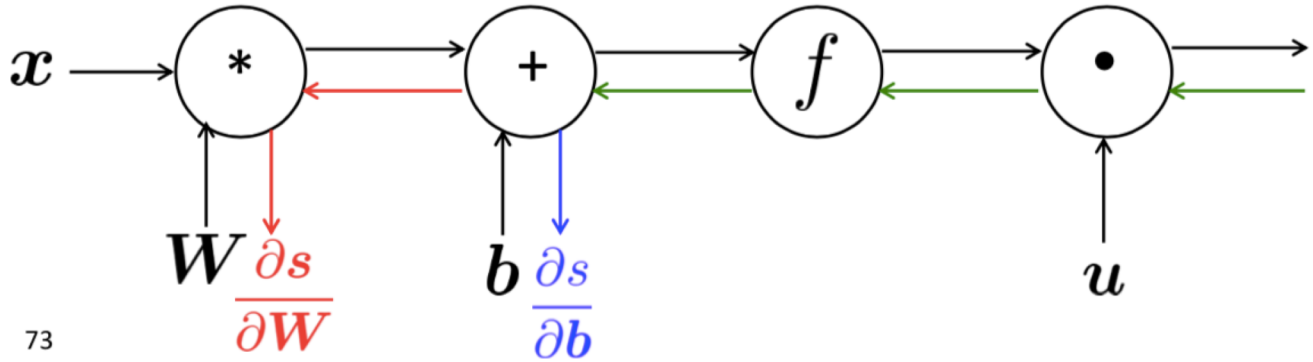


72

Backpropagation Algorithm

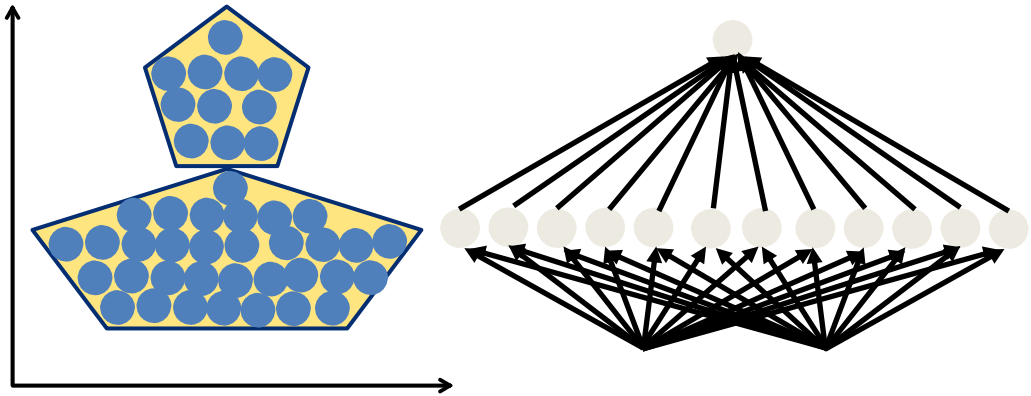
Compute derivatives of the loss wrt to all parameters of the network

- breakdown the networks computation into small steps
- define local derivatives of outputs wrt to inputs
- recursively apply the chain rule to compose derivatives
- **re-use intermediate values computed in previous steps**



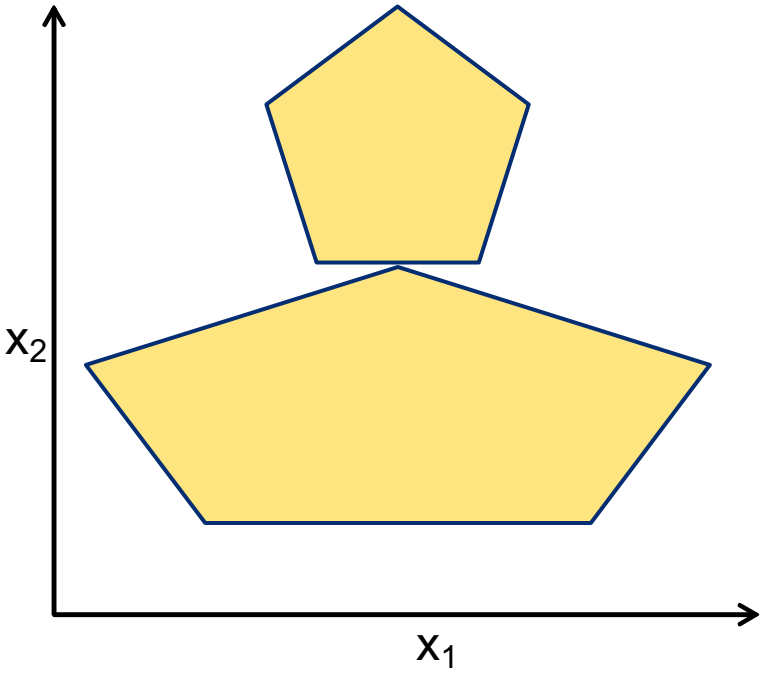
Multilayer Perceptron

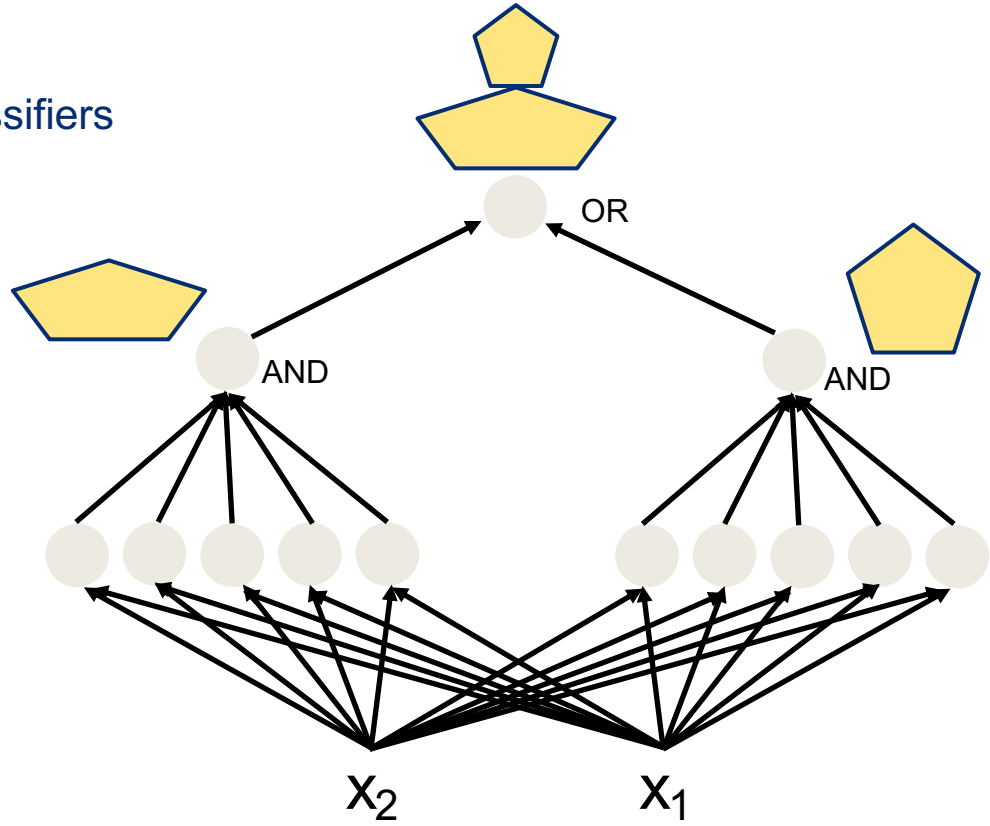
Multilayer Perceptrons are Universal Function Approximators



Multilayer Perceptron

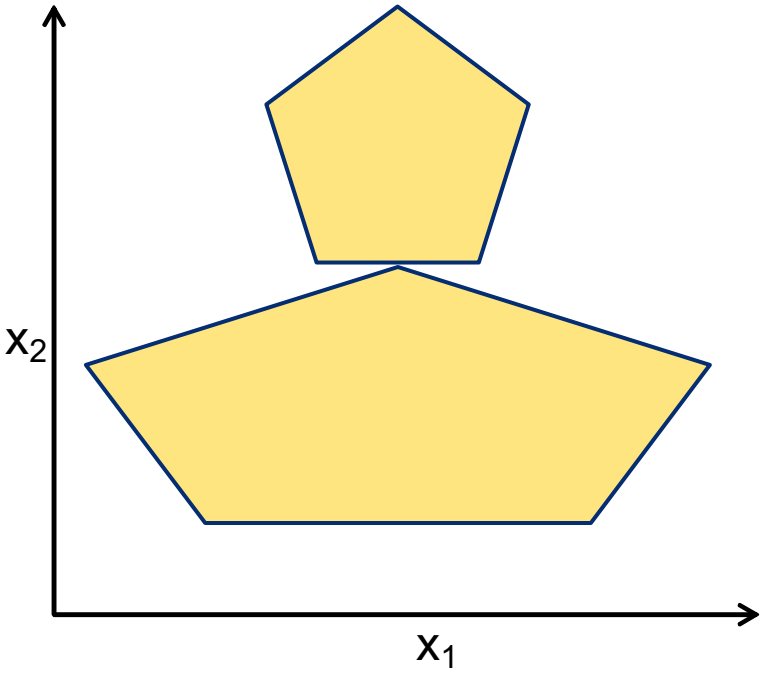
Multilayer Perceptrons are Universal Classifiers

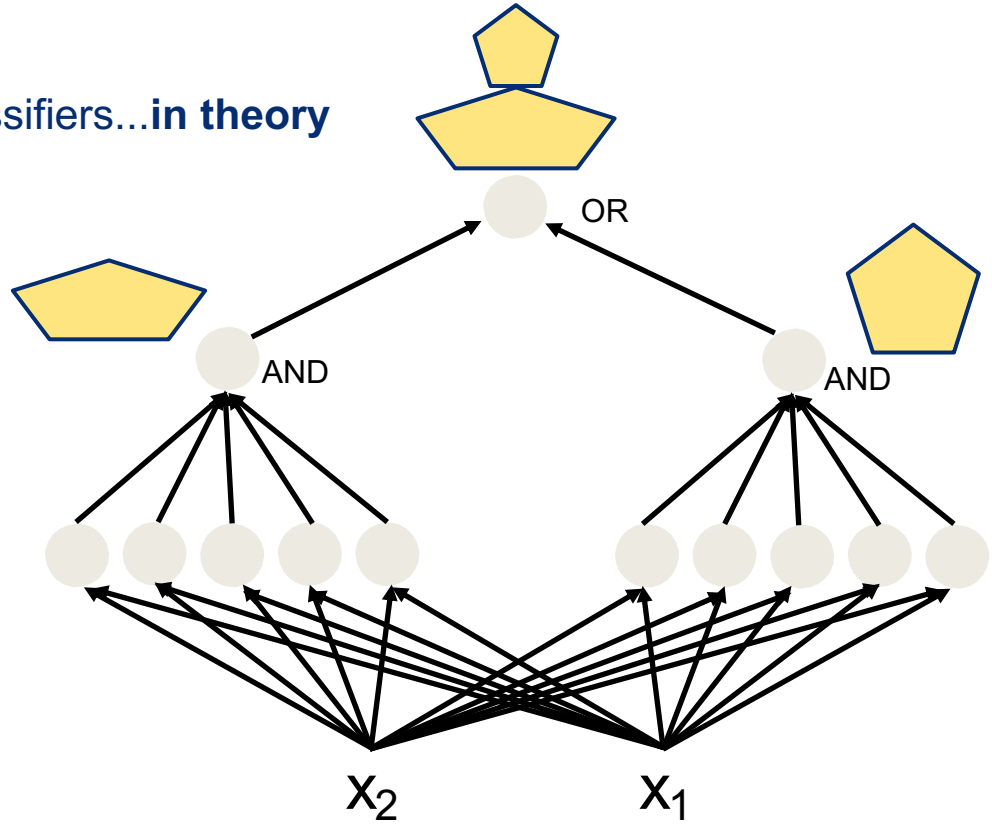




Multilayer Perceptron

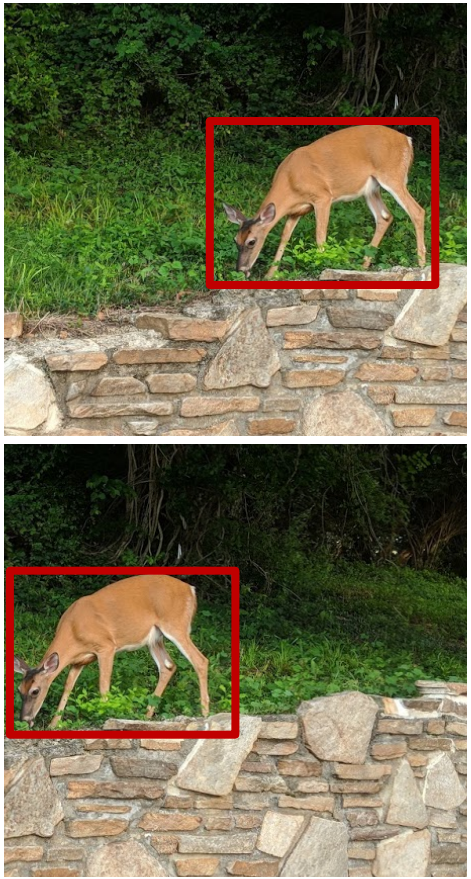
Multilayer Perceptrons are Universal Classifiers...**in theory**





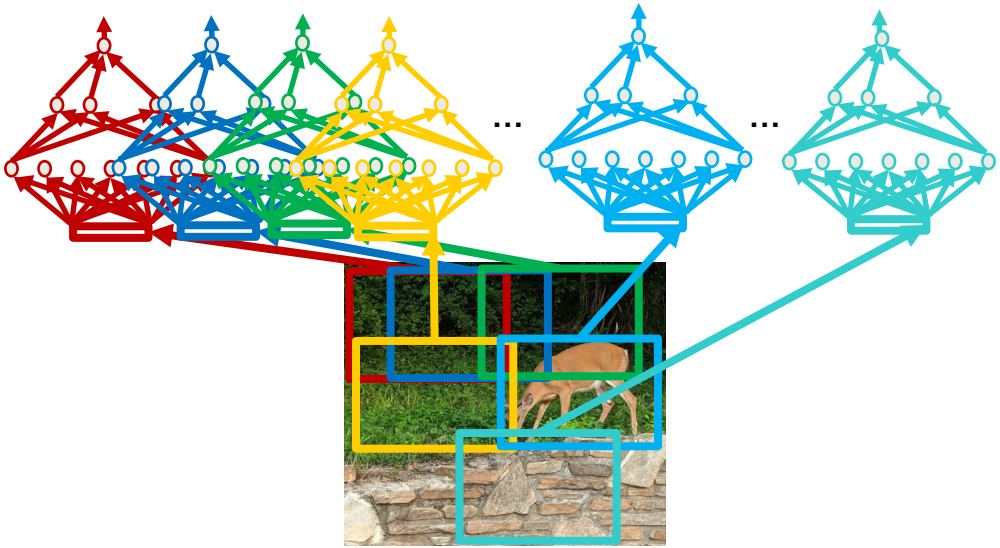
Pattern Recognition

Conventional MLPs are sensitive to location, but often the **location** of a pattern **is not important**!



Scanning with a MLP

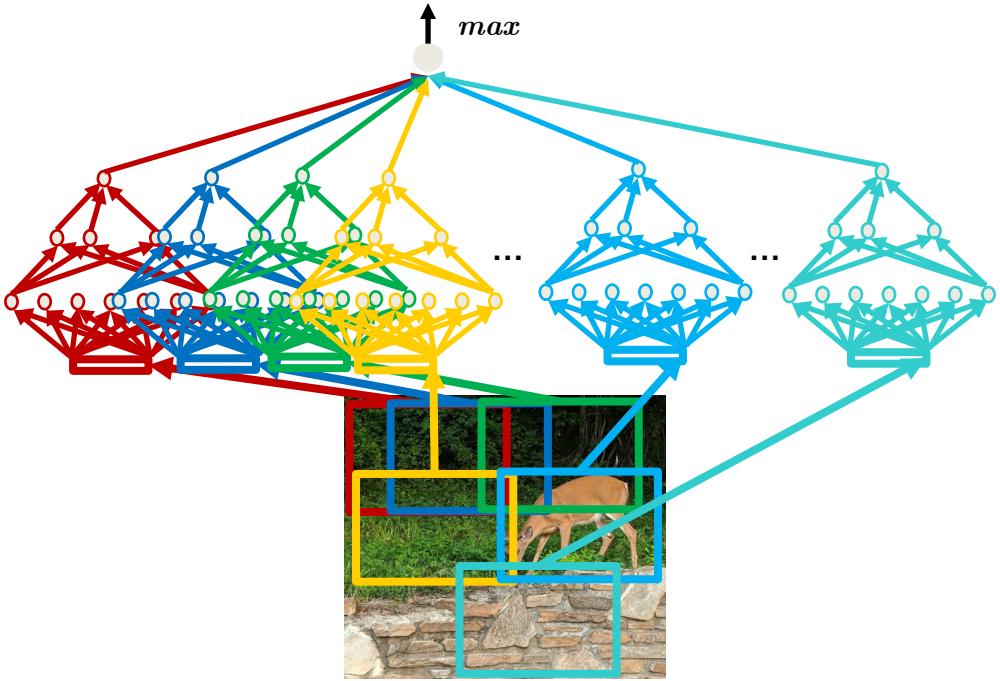
Shift invariance can be achieved by scanning with a MLP



Scanning with a MLP

Shift invariance can be achieved by scanning with a MLP

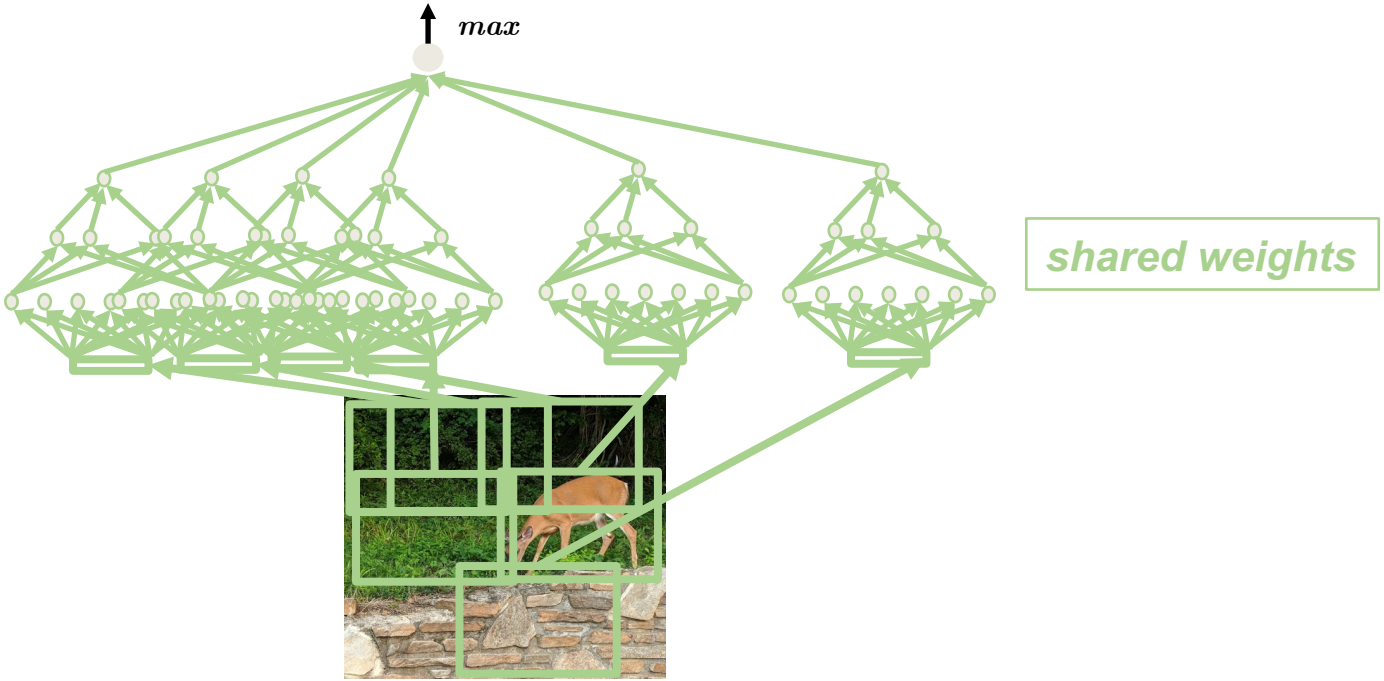
Combine multiple local predictions



Scanning with a MLP

Shift invariance can be achieved by scanning with a MLP

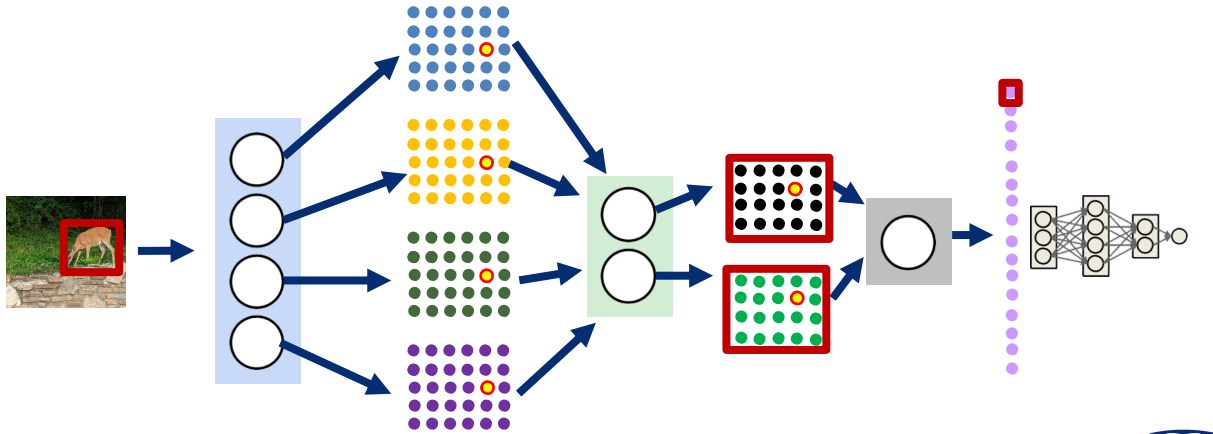
Combine multiple local predictions



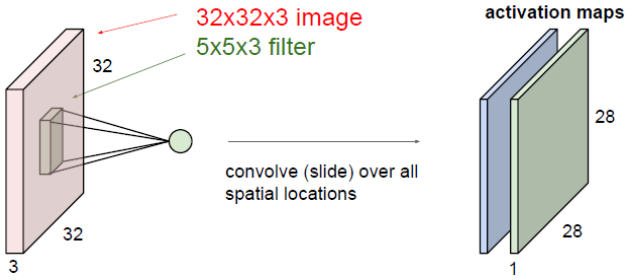
Scanning with a MLP

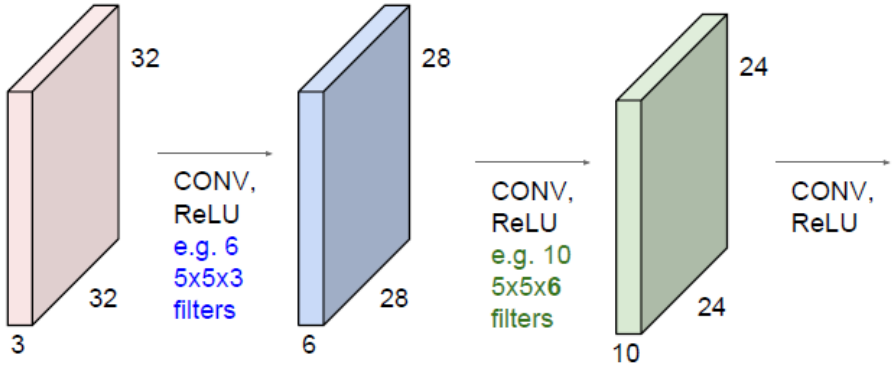
Better approach: scan the input one layer at a time

- Hierarchical features
- Compositionality



Convolutional Layers





Input volume: **32x32x3**
10 5x5 filters with stride 1, pad 2

Output volume size:
(32+2*2-5)/1+1 = 32 spatially, so
32x32x10

Number of parameters in this layer?
each filter has 5*5*3 + 1 = 76 params (+1 for bias)
=> 76*10 = **760**

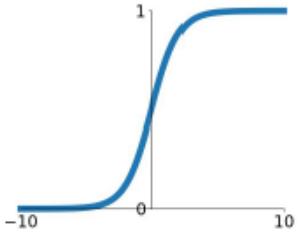
Recap

Deep Neural Networks

The Zoo of Common Activation Functions

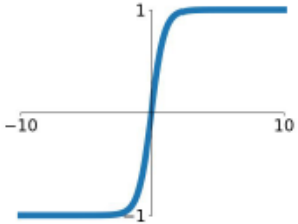
Sigmoid

$$\sigma(x) = \frac{1}{1+e^{-x}}$$



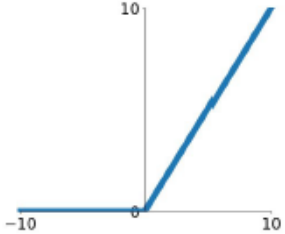
tanh

$$\tanh(x)$$



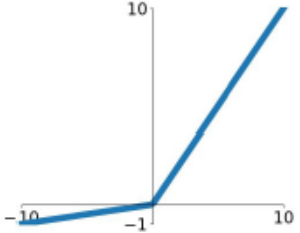
ReLU

$$\max(0, x)$$



Leaky ReLU

$$\max(0.1x, x)$$

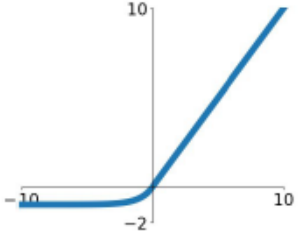


Maxout

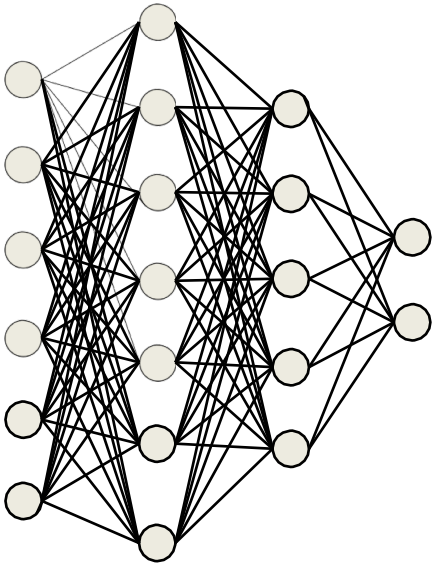
$$\max(w_1^T x + b_1, w_2^T x + b_2)$$

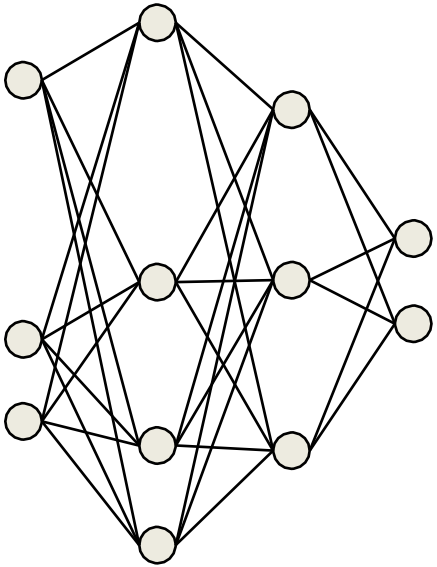
ELU

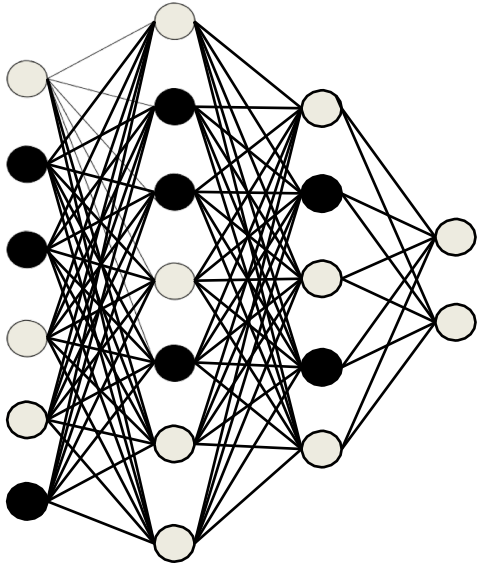
$$\begin{cases} x & x \geq 0 \\ \alpha(e^x - 1) & x < 0 \end{cases}$$



Dropout





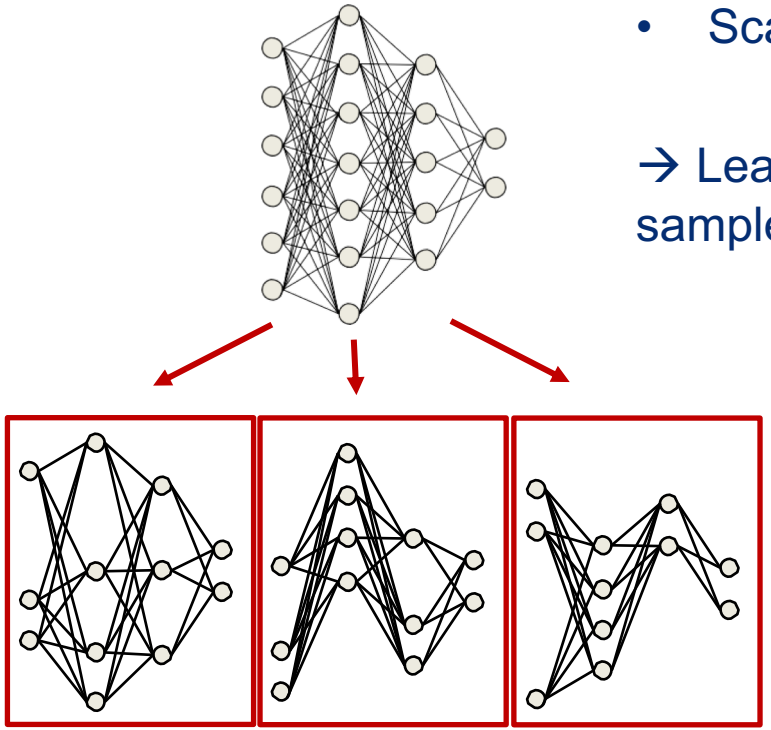


During training

- At each iteration, in each layer, “knock out” each neuron with probability 1-α
- In practice, we do not drop connections but set inputs/outputs to zero

Srivastava, N., Hinton, G., Krizhevsky, A., Sutskever, I., & Salakhutdinov, R. (2014). Dropout: a simple way to prevent neural networks from overfitting. JMLR, 15(1), 1929-1958.

Dropout



Inference

- Scale weights or activations

→ Learns a N-neuron network that averages over a sample of 2^N possible sub-networks

Batch Normalization

1. Compute empirical mean and variance for each channel

$$E[x^{(k)}], \mathrm{Var}[x^{(k)}]$$

2. Normalize to unit Gaussian

$$\hat{x}^{(k)} = \frac{x^{(k)} - E[x^{(k)}]}{\sqrt{\mathrm{Var}[x^{(k)}]}}$$

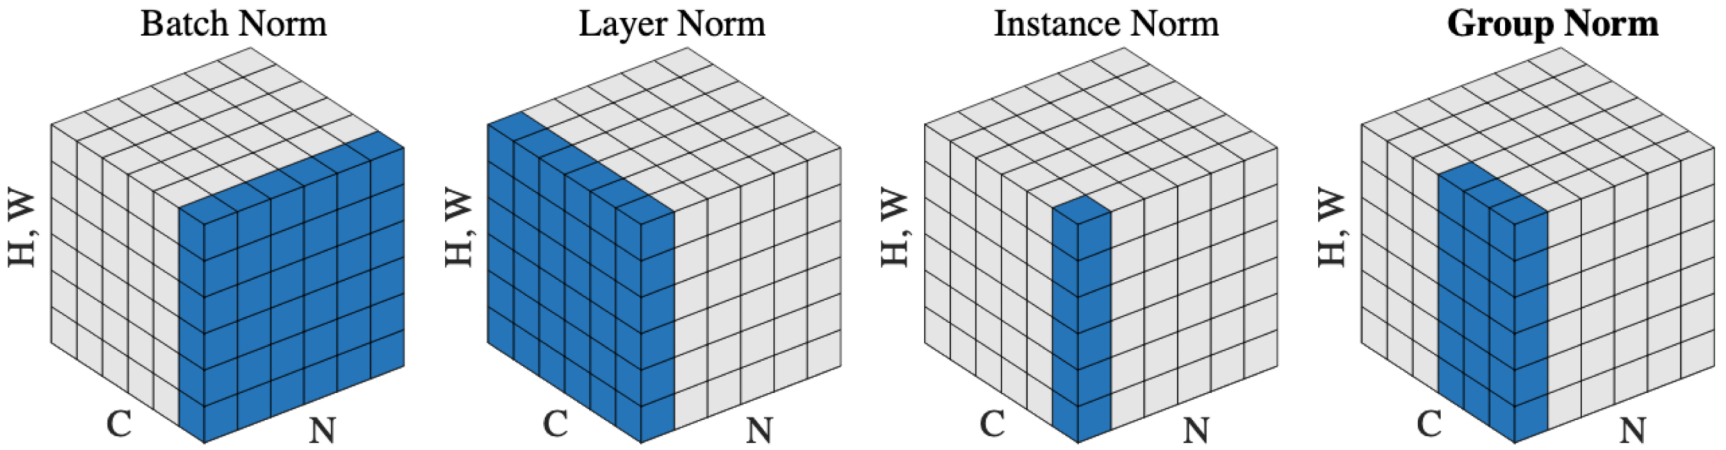
3. Squash output to beneficial range

$$y^{(k)} = \gamma^{(k)} \hat{x}^{(k)} + \beta^{(k)}$$

These are parameters and are learned during training.

Ioffe, S., & Szegedy, C. (2015). Batch normalization: Accelerating deep network training by reducing internal covariate shift. arXiv:1502.03167.

Normalization Methods

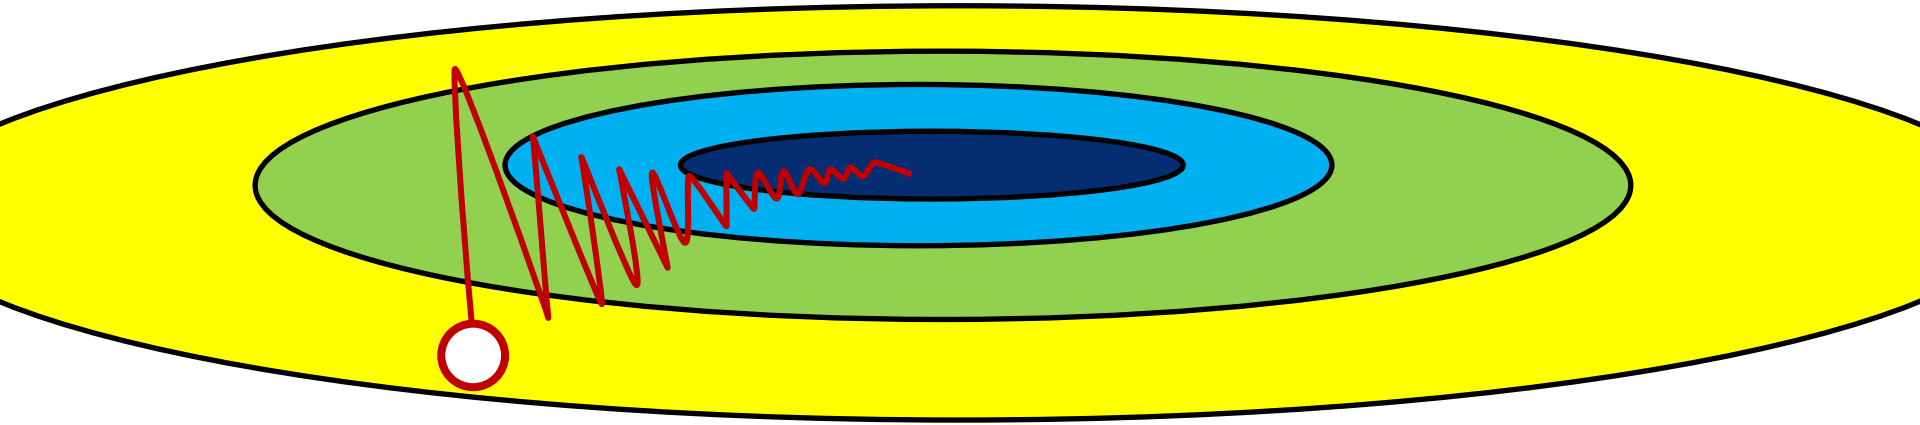


Wu, Y. and He, K., 2018. Group normalization. arXiv preprint arXiv: 1803.08494.

Problems with SGD Optimization

→ Slow progress along shallow dimension, jitter along the other

→ Problematic: Neural networks have millions of parameters!



Why is this?

Condition number: Ratio of largest to smallest singular value of the Hessian

→ If large, then loss function at this point badly conditioned

Another Problem

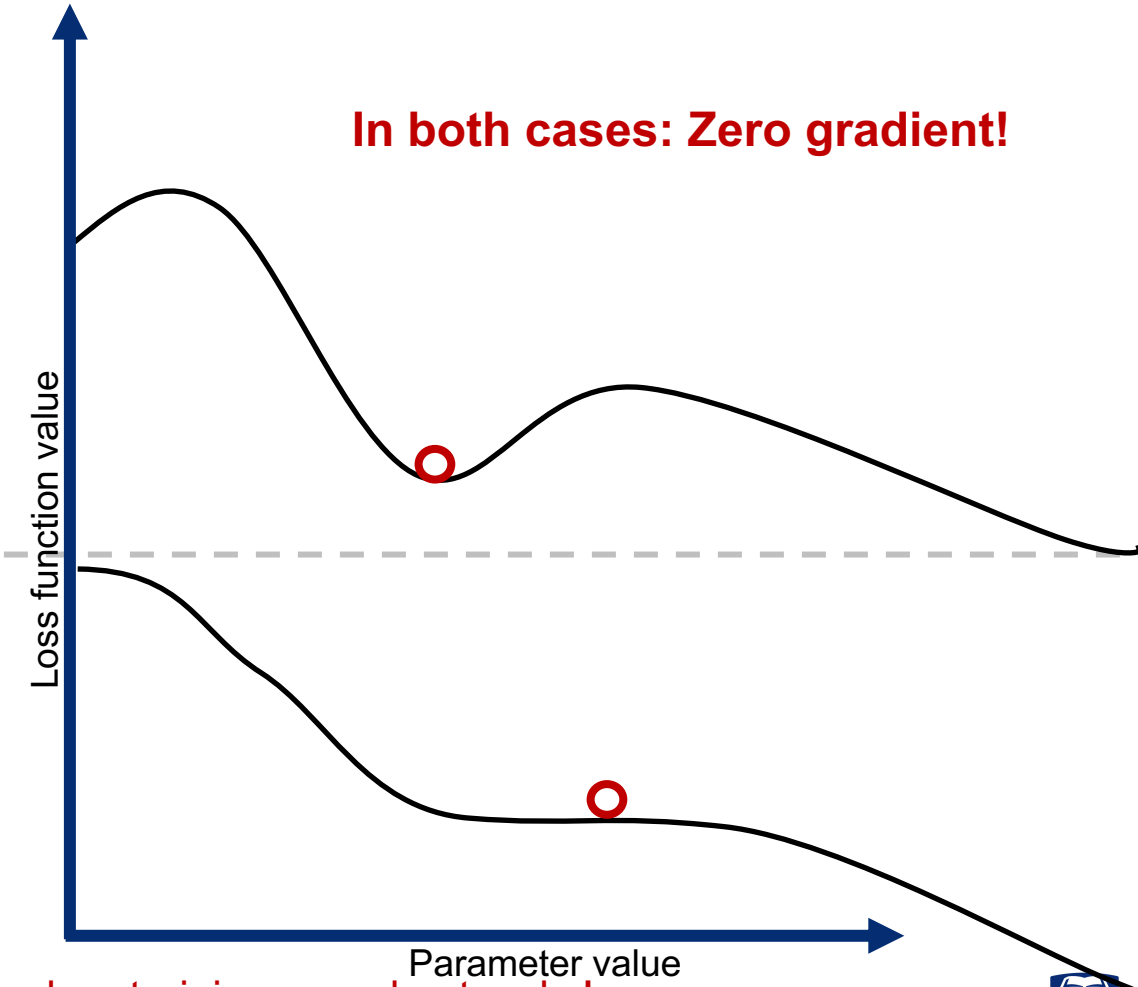
Local minimum

In every direction, loss will go up.

Saddle point

In some direction loss will go up,
in other direction loss will go down.

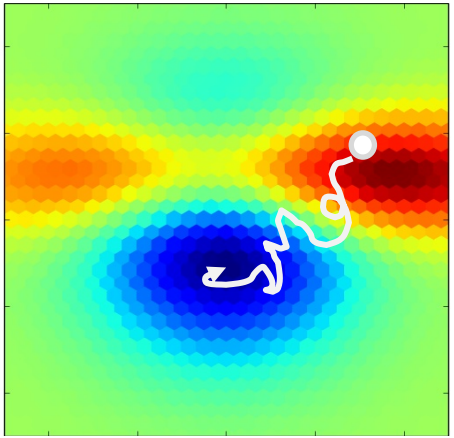
In high dimensional space, this scenario is much more common.



→ Saddle points are the big problem when training neural networks!

And Another Problem

```
while not_converged:
    data_batch = sample_training_data(data, batch_size)
    gradient = eval_gradient(loss, data_batch, weights)
    weights += - step_size * gradient
```



Gradient is computed over mini-batches

- Mini-batches do not necessarily represent the full dataset
- **Gradients can be noisy!**

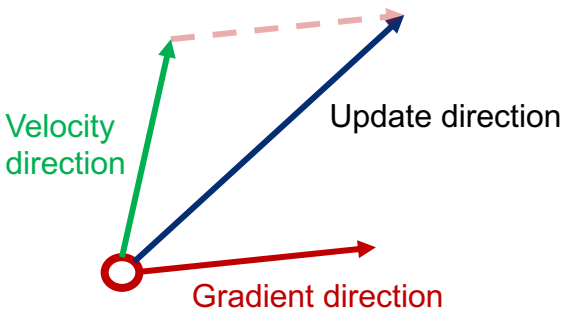
Adding Momentum

Nesterov, Y. E. (1983). A method for solving the convex programming problem with convergence rate O (1/k^ 2). In *Dokl. Akad. Nauk SSSR* (Vol. 269, pp. 543-547).
Sutskever, I., Martens, J., Dahl, G., & Hinton, G. (2013, February). On the importance of initialization and momentum in deep learning. In International conference on machine learning (pp. 1139-1147).

SGD + Momentum

$$v_{t+1} = \rho v_t - \alpha \nabla_W L(W_t)$$
$$W_{t+1} = W_t + v_{t+1}$$

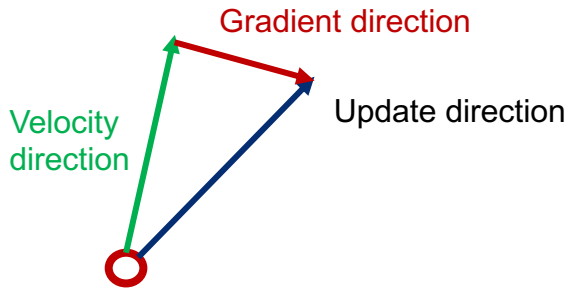
Combine gradient at current point with velocity to get update



Nesterov Momentum

$$v_{t+1} = \rho v_t - \alpha \nabla_W L(W_t + \rho v_t)$$
$$W_{t+1} = W_t + v_{t+1}$$

Evaluate gradient at where velocity would take us, then mix with velocity



AdaGrad

Duchi, J., Hazan, E., & Singer, Y. (2011). Adaptive subgradient methods for online learning and stochastic optimization. *JMLR*, 2121-2159.

$$g_t = \nabla_W L(W_t)$$

$$S_i = S_i + (g_t)_i^2 \quad \text{with } S_i(t=0) = 0$$

$$(\mathrm{d}W_t)_i = \frac{\alpha}{\sqrt{S_i} + \epsilon}(g_t)_i$$

$$W_{t+1} = W_t - \mathrm{d}W_t$$

1. Compute gradient
2. Compute and accumulate element-wise squared gradient
3. Compute gradient update with **parameter-wise** learning rate
4. Apply gradient update

Adam

Kingma, D. P., & Ba, J. (2014). Adam: A method for stochastic optimization. arXiv:1412.6980.

$$g_t = \nabla_W L(W_t)$$

$$S_i^{(1)} = \left(\rho_1 S_i^{(1)} + (1-\rho_1)(g_t)_i\right)(1-\rho_1^t)^{(-1)}$$

$$S_i^{(2)} = \left(\rho_2 S_i^{(2)} + (1-\rho_2)(g_t)_i^2\right)(1-\rho_2^t)^{(-1)}$$

Bias correction

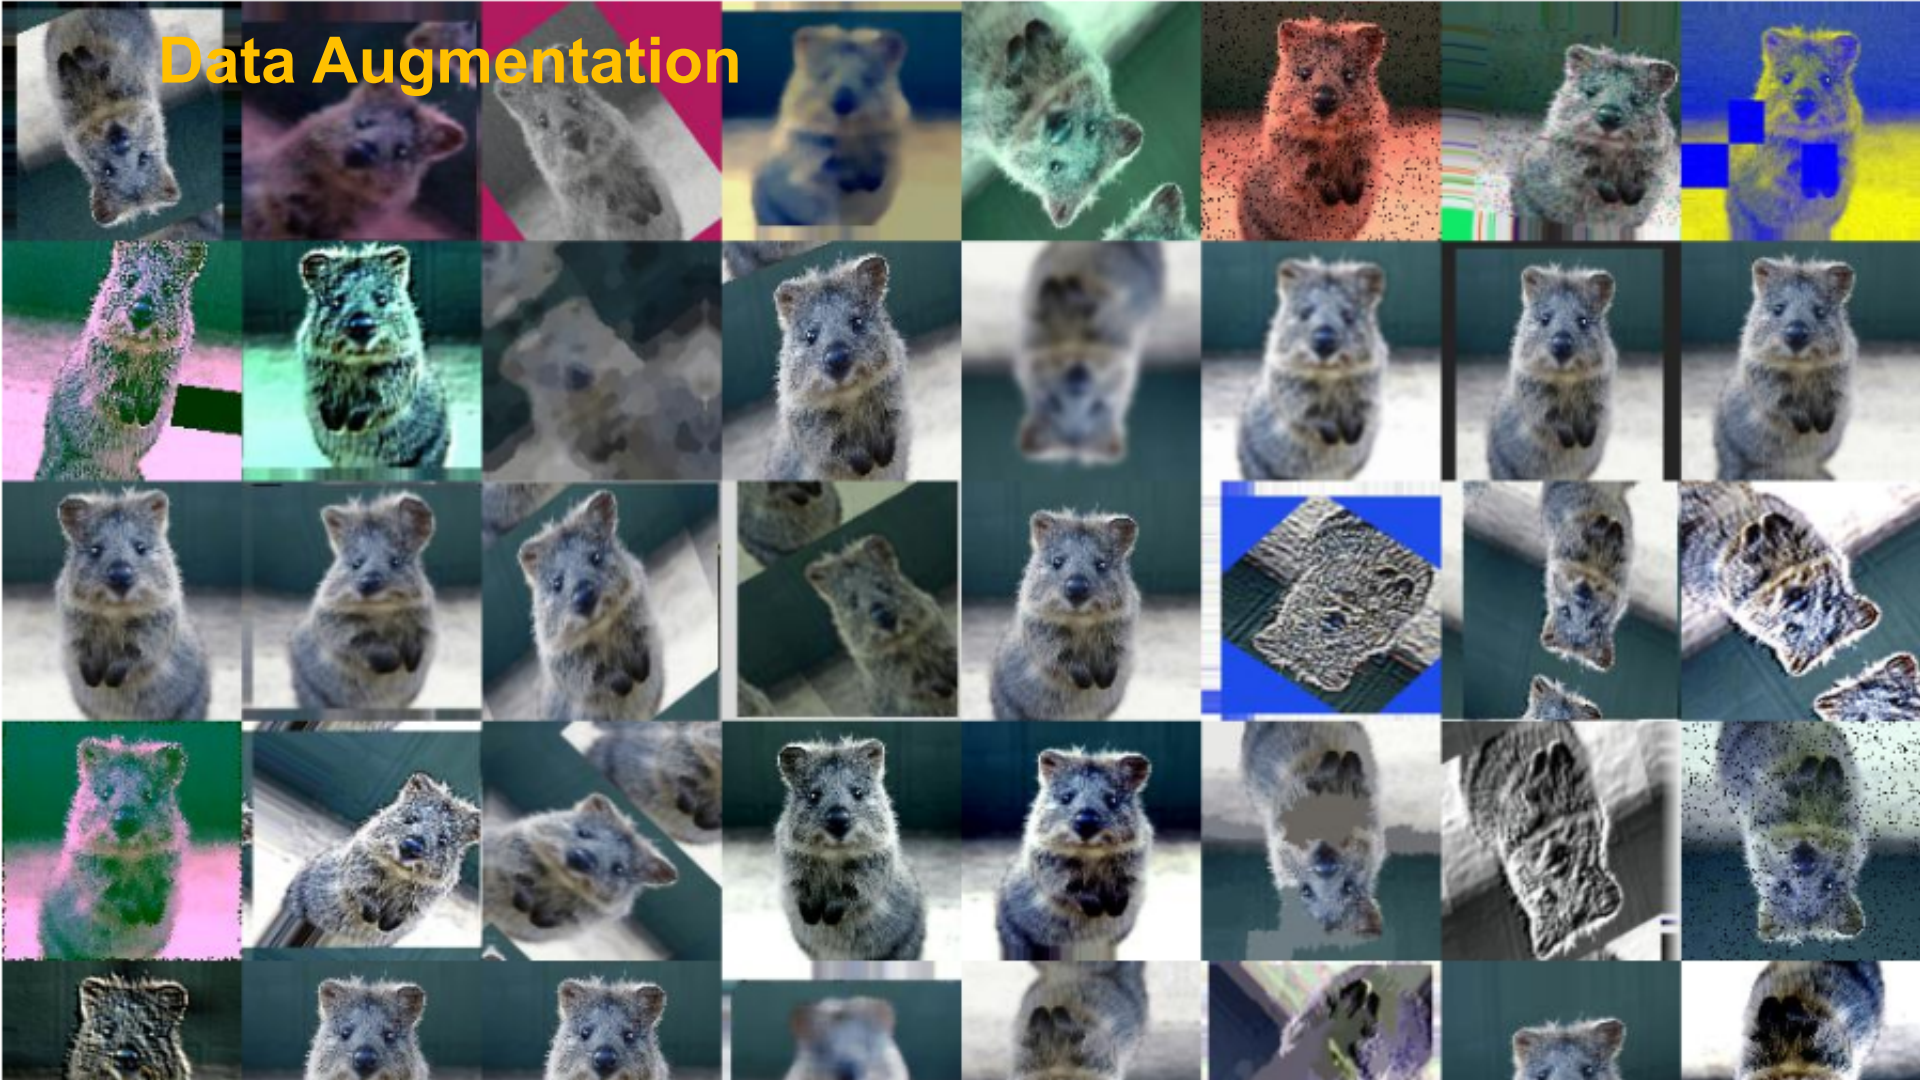
$$(\mathrm{d}W_t)_i = \frac{\alpha}{\sqrt{S_i^{(2)}} + \epsilon} S_i^{(1)}$$

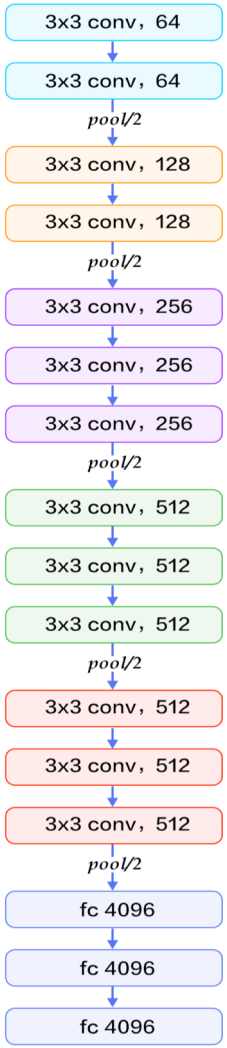
$$W_{t+1} = W_t - \mathrm{d}W_t$$

$$S_i^{(1)}(t=0) = 0$$
$$S_i^{(2)}(t=0) = 0$$

1. Compute gradient
2. Compute first momentum (“velocity”)
3. Compute second momentum (parameter-wise normalization)
4. Compute update with **momentum** and **parameter-wise** learning rate
5. Apply update

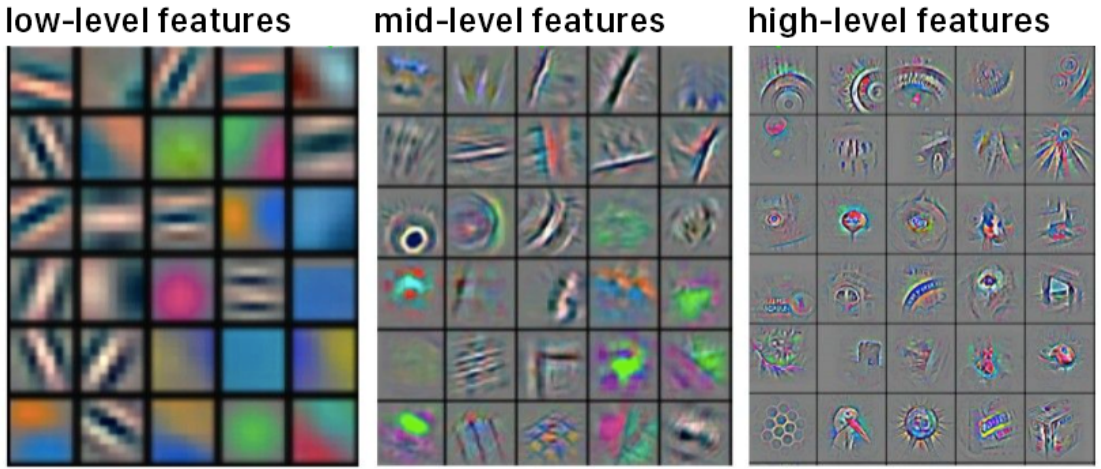
Data Augmentation





Transfer Learning

Fairly generic



Sharif Razavian, A., Azizpour, H., Sullivan, J., & Carlsson, S. (2014). CNN features off-the-shelf: an astounding baseline for recognition. CVPR (pp. 806-813).
